Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon the caroten substrates.

Claim 23; Page 146; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopertenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

~

the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii beta-carotene hydrolase (CrtZ) enzyme used in the invention

****************

Novel isolated mucleic acid useful e.g. to engineer host cells with the ability to produce particular carotenoids and polypeptides useful in cell-free systems to make particular carotenoids.

Claim 38; Page 65-66; 74pp; English.

The invention comprises the amino acid and coding sequence of a number of carotenoid (crt)-related proteins. The crt-related DNA and protein agequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents a crt-related protein of the invention

encoding nucleic acid molecule isolated from Pantoea stewartii encoenoid biosynthetic enzyme, useful for regulating carotenoid biosynthesis in an organism Novel 

Claim 4; Page 67-68; 68pp; English.

The present invention describes Pantoea stewartii carotemoid biosynthetic enzymes (1). More specifically described are the geranylgeranyl pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), lycopene cyclase (crtZ), phytoene gyuthase (crtZ) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (1) can be used for regulating carotemoid biosynthesis in an organism, (1) can be used for regulating organism, such that the carotemoid biosynthesis is altered in the organism. (1) and the genes encoding (1) are useful for converting phytoene to the carotemoids, for creating recombinant organisms that have the ability to produce various carotemoid compounds, and also for enhancing or manipulating carotemoid compounds, and also for enhancing or manipulating encodends. (1) can also be used for producing gene products having enhanced or altered activity

```
The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtB, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 ESILLIYLGSTGWWPLQWIGAGWTAYGLLYFWYHDGLVHQRWPPRYIPRKGYLKRLYMAH 120

                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of producing or enhancing production of a carotenoid in a host cell. The method comprises inserting into the cell a vector comprising a hetrologous nucleic acid sequence encoding a protein with epsilon-cyclase enzyme activity operably linked to a promoter, and expressing the heterologous sequence to produce the protein. ABG93886.ABG93914 represent epsilon-cyclase, isopentenyl pyrophosphate isomerase and beta-carotene hydroxylase proteins of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 VSIALIYFGSTGIWPLQWIGAGMTAYGLLYFWVHDGLVHQRWPFRYIPRKGYLKRLYMAH 120

```
coli celle to produce GGPP and the carotenoids phytoene through
zeaxanthin diglucoside, which is the final prod. identified in the
carotenoid pathway contd. in plasmid pakers (cong a ca. 13 kb
carotenoid pathway contd. in plasmid pakers (cong a ca. 13 kb
chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168.607
(1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase,
phytoene synthase, phytoene dehydrogenase-44, lycopene cyclase, beta-
carotene hydroxylase, and zeaxanthin glycoplase are represented in
AAQ13716, AAQ13718, AAQ13792, AAQ13724 and AAQ13726
respectively. The native sequence (AAQ13724) was genetically engineered.
At the 5' and of the agene, codons encoding the native second and third
amino acid have been changed from Leu-Val to Val-Leu. Recombinant
expression plasmids can be used to produce large amts. of the enzymes and
thence large amts. of the carotenoids which they synthesise. (Updated on
25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR
field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Biosynthesis of carotenoid(s) in genetically engineered hosts - using DNA encoding enzymes from Erwinia herbicola.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62
                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of producing or enhancing production a carotennid in a host cell. The method comprises inserting into the ce a vector comprising a heterologous nucleic acid sequence encoding a protein with epsilon-cyclase enzyme activity operably linked to a promoter, and expressing the heterologous sequence to produce the protein. ABC91386-ABG93914 represent epsilon-cyclase, isopentenyl pyrophosphate isomerase and beta-carotene hydroxylase proteins of the invention. (Updated on 29-AUG-2003 to standardise OS field)

```
AAR79058-R790629 are xanthophyll polypeptides. These polypeptides are capable of converting the 4-methylene group of a 3-hydroxy-beta-ionone ring to a 4-keto group in doing so these peptides also add a hydroxyl group to the 3-position carbon-atom of the 4-keto-beta-ionone ring. The DNA sequences may be used in the production of astaxanthine and other keto gp. contg. xanthophylls, the sequences may also be used to transform certain yeasts and other microorganisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   67 YPGSTGIWP-LQWIGAGMTAYGLLYFMVHDGLVHQRWPFRYIPRKGYLKRLYMAHRMFHA 125

                                                                                                                                                                                                                                                                      4
                                                                                                  The present sequence represents a protein involved in carotenoid biosynthemis. The specification describes astaxanthin diglucosides and admixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtB, crtB, crtI, crtY, crtZ, crtK or are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives

AAR79058-R796629 are xanthophyll polypeptides. These polypeptides are capable of converting the 4-methylene group of a 3-hydroxy-bera - ionone ring to a 4-keto group in doing so these peptides also add a hydroxyl group to the 3-position carbon-atom of the 4-keto-bera- ionone ring. The DNA sequences may be used in the production of astaxanthine and other etero group to ontg. xanthophylls, the sequences may also be used to transform certain yeasts and other microorganisms. (Updated on 27-AUG-2003 to correct OS field.)

The invention specifically describes the isolation of a 3-bydroxy-3 methylglutaryl coenzyme A (HWG-CoA) reductase protein. This sequence represents the Candida utilis crtZ protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

```
The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtE, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucosides, adonixanthin-3'-glucosides are used as food additives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              65 LIYFGSTGIWP--LØWIGAGMTAYGLLYFMVHDGLVHQRWPFRYIPRKGYLKRLYMAHRM 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes the preparation of carotenoid pigments e.g. canthaxanthins using a cell transformed by a vector having DNA sequences (a) to (e) or substantially homologous sequences. (a) a DNA sequence (crtE) coding GGPP synthase of Plavobacterium sp. R1534; (b) a DNA sequence (crtI) coding prephytoene synthase of Flavobacterium sp. R1534; (c) a DNA sequence (crtI) coding phytoene desaturase of Plavobacterium sp. R1534; (d) a DNA sequence (crtY) coding lycopene cyclase of Plavobacterium sp. R1534, and (e) a DNA sequence (crtY) coding lycopene cyclase of Plavobacterium sp. R1534, and (e) a DNA sequence (crtV) coding lycopene cyclase of Plavobacterium sp. R1534, and sequence (crtV) coding lycopene cyclase of Plavobacterium sp. R1534, and sequence (crtV) coding lycopene cyclase of carotenoid mixture can also be used in preparation of food products. The method is an improved method of fermentation for carotenoid
                                                                                                                                                                                                             LIYFGSTGIWP--LQWIGAGMTAYGLLYFMVHDGLVHQRWPFRYIPRKGYLKRLYMAHRM 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a fusion between the SSU leader and a beta-carotene hydroxylase encoded by the crtZ gene (see AAX25067) of A. auriantiacum. The xanthophyll content of seeds can be altered by transforming cells of a host plant with at least one construct containing: (i) a transcription initiation region of a gene that is preferentially expressed in seeds; (ii) the sequence for a plastid transit peptide; (iii) DNA from a carotenoid synthesis gene coding region, and (iv) a transcription terminator. The transformed cells are regenerated to plants and these, or their progeny, grown to produce seeds. The method is especially used to increase the carotenoid content in oilseed plants. Coexpression of beta-carotene hydroxylase and beta-carotene ketolase (see AAW8198) results in increased astaxanthin and zeaxanthin content in the seeds of transformed plants
                                                                                                                                                                                                                                                                                      Btea-carotene hydroxylase; crt2 gene; carotenoid; xanthophyll; pigment; astaxanthin; zeaxanthin; transgenic plant; oilseed plant; seed oil; A. auriantiacum.

Submitted (AUG-2002) to the EMBL/GenBank/DDBJ databases.
-i- FUNCTION: Catalyzes the reaction from prephytoene diphosphate to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 phytoene.
-!- PATHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene/squalene synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pantoea ananas (Erwinia uredovora).

Submitted (FEB-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes the reaction from prephytoene diphosphate to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                         phytoene.
-!- CATALYTIC ACTIVITY: 2 geranylgeranyl diphosphate = diphosphate +
                                                                                                                                                                                                                                                                             phytoene.
-!- PATHWAY: Carotenoid biosynthesis.
-!- SIMILARITY: Belongs to the phytoene/squalene synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 227 RSAWALATAKQVYRKIGVKVEQAGKQAWDHRQSTSTAEKLTLLLTASGQA 276
